DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 2. Claims 1, 6, 12-13, 21-22, 25-26, 28, 33 are rejected under 35 U.S.C. 102(b) as being anticipated by Brown (4,646,036).

Consider claim 1. Brown teaches a system for providing linearized operation of a RF circuit, comprising a first transistor differential pair (40 and 47); a second transistor differential pair (48 and 55); a control signal input port (22); a first control signal output port (output of LPF 67-68 or the anode of PIN diode 15), wherein the first control signal output port is coupled to the control signal input port through the first transistor differential pair; a second control signal output port (output of LPF 70-71 or the anode of PIN diode 18), wherein the second control signal output port is coupled to the control signal input port through the second transistor differential pair.

Consider claim 6. Brown's Fig. 3 meets the limitations of this claim (the base of transistor 40).

Consider claim 12. Brown's Fig. 3 reads on the limitations of this claim (the first and second control signal outputs are derived by transistors 40, 47, 48 and 55).

Consider claim 13. Brown's Fig. 3 meets the limitations of this claim (the base of the transistor 55).

·Application/Control Number: 09/970,311

Art Unit: 2643

Consider claim 21. Brown's fig. 3 reads on the limitations of this claim (bipolar transistors).

Consider claim 22. Brown's fig. 3 does not show a MOSFET differential pair. However, it is well known to one skilled in the art to use FETs, MOSFETs in place of bipolar junction transistor in order to achieve faster switching, and low power consumption.

Consider claim 25. Brown teaches a system for providing linearized operation of a RF circuit, comprising a first transistor differential pair (40 and 47); a second transistor differential pair (48 and 55); a control signal input port (22); a first control signal output port (output of LPF 67-68 or the anode of PIN diode 15), wherein the first control signal output port is coupled to the control signal input port through the first transistor differential pair; a second control signal output port (output of LPF 70-71 or the anode of PIN diode 18), wherein the second control signal output port is coupled to the control signal input port through the second transistor differential pair. The series PIN diode bias current is met by PIN diode (15) and the shunt PIN diode bias current is met by PIN diode (18).

Consider claim 26. Brown's Fig. 3 meets the limitations of this claim (the base of transistor 40 and the base of the transistor 55).

Consider claim 28. Brown's Fig. 3 reads on the limitations of this claim (the first and second control signal outputs are derived by transistors 40, 47, 48 and 55).

Consider claim 33. Brown teaches a system for providing linearized operation of a RF circuit, comprising a first transistor differential pair (40 and 47); a second transistor differential pair (48 and 55); a control signal input port (22); a first control signal output port (output of LPF 67-68 or the anode of PIN diode 15), wherein the first control signal output port is coupled to the

'Application/Control Number: 09/970,311

Art Unit: 2643

control signal input port through the first transistor differential pair; a second control signal output port (output of LPF 70-71 or the anode of PIN diode 18), wherein the second control signal output port is coupled to the control signal input port through the second transistor differential pair. The series PIN diode bias current is met by PIN diode (15) and the shunt PIN diode bias current is met by PIN diode (18) (e.g., the first and second control signal outputs are derived by transistors 40, 47, 48 and 55).

Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claims 2-5, 34 are rejected under 35 U.S.C. 103(a) as being unpatentable over Brown (4,646,036) in view of Gruneisen (6,091,299)

Consider claim 2. Brown does not clearly teach a PIN diode attenuator circuit providing decibel per volt linear gain control by the system.

Gruneisen teaches a PIN diode attenuator circuit providing decibel per volt linear gain control by the system (col. 5, ln. 66 to col. 6, ln. 15; fig. 3).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to utilize the teachings of Gruneisen into the teachings of Brown in order to provide a method and apparatus for linearizing the response of PIN diode attenuators that does not change slope with variations of temperature.

'Application/Control Number: 09/970,311

Art Unit: 2643

Consider claim 3. The series PIN diode bias current is met by PIN diode (15).

Consider claim 4. The shunt PIN diode bias current is met by PIN diode (18).

Consider claim 5. Brown further teaches that the first and second output control signals cooperate to control the PIN diode attenuator circuit to provide an optimized impedance match (col. 5, ln. 55 to col. 6, ln. 6). Gruneisen further teaches providing an optimized impedance match over a dynamic attenuator range of at least 30dB (fig. 3, col. 5, ln. 66 to col. 6, ln. 15).

Consider claim 34. Gruneisen further teaches a PIN diode attenuator circuit providing decibel per volt linear gain control by the system (col. 5, ln. 66 to col. 6, ln. 15; fig. 3).

Allowable Subject Matter

- 5. Claims 7-11, 14-20, 23-24, 27, 29-32, 35-37 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
- 6. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Duc Nguyen whose telephone number is 703-308-7527. The examiner can normally be reached on 6:00AM-2:30PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Curtis Kuntz can be reached on 703-305-4708. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
